

From churn risk to governed, evidence-backed retention learning

Who should we retain, what should we do, did it work — and what should we try next?

EXAMPLE

A top-5% risk customer is explained, gets a push with a 20% coupon, is measured — and a new idea is proposed.

1.00

PRIORITIZATION

Precision@Top 5%

Focus retention effort on customers with the highest modeled risk.

Explain

ACTIONABILITY

Explainable retention actions

Turn risk into reviewable, testable interventions.

KPI +

MEASUREMENT

Primary KPI and guardrails

Judge actions by evidence, not by model confidence.

REACT

CONTINUOUS IMPROVEMENT

Evidence-backed next actions

Candidate actions for the next cycle, built from completed tests.

WHY IT MATTERS

- Who should we retain?
- What should we do?
- Did it work?
- What should we try next?

BUSINESS INTERPRETATION

- Prediction is one component, not the final product.
- The system connects action, measurement and governed learning.
- Consequential decisions remain controlled and traceable.

A governed loop from action to evidence — and back to action

Evidence informs the next reviewable action while people retain decision rights.

SYNTHETIC INTERVENTION EVIDENCE

Validated against 16 synthetic known-ground-truth scenarios.

WHAT HAPPENS NEXT — REACT

The system combines internal evidence and trusted external sources to generate reviewable candidate actions for the next test cycle. Results and decisions are preserved so the retention strategy keeps expanding and being evaluated.

EXAMPLE FROM THE DEMO (SYNTHETIC DATA)

A tested abandoned-cart email timing change (1 hour vs 24 hours) raised cart recovery by +1.7% with no guardrail risks. A new sourced proposal, an exit-intent discount popup, awaits human approval to be tested.

GOVERNANCE

Human review frames the loop: approve, refine or reject candidate actions before consequential use.

EVIDENCE BOUNDARY

Synthetic intervention and measurement evidence remains explicit. No observed real-customer uplift, production ROI or enterprise-scale operations are claimed. Uplift modeling is outside current scope.

Portfolio REACT uses validated free-access sources; production deployments can connect paid research APIs to broaden external evidence coverage.
